Epigenetics is the study of heritable phenotype changes that do not involve alterations in the DNA sequence. The Greek prefix epi- (ἐπί-"over, outside of, around") in epigenetics implies features that are "on top of" or "in addition to" the traditional genetic basis for inheritance. Epigenetics most often denotes changes that affect gene activity and expression, but can also be used to ...

Cancer epigenetics is the study of epigenetic modifications to the DNA of cancer cells that do not involve a change in the nucleotide sequence. Epigenetic alterations may be just as important, or even more important, than genetic mutations in a cell's transformation to cancer. In cancers, loss of expression of genes occurs about 10 times more frequently by transcription silencing (caused by ...

Solutions For Screening Epigenetic Regulators. For over a decade, the FLUOR DE LYS[®] deacetylase assay platform has freed researchers from cumbersome protocols for screening HDAC & Sirtuin activity. Our high-quality chemiluminescent, fluorescent, and colorimetric assays deliver more high-quality hits, and are backed by a broad panel of characterized inhibitors and PTM-specific antibodies for ...

Epigenetics is the study of changes in gene activity which are not caused by changes in the DNA sequence. It is the study of gene expression, the way genes bring about their phenotypic effects.. These changes in gene activity may stay for the remainder of the cell's life and may also last for many generations of cells, through cell divisions. However, there is no change in the underlying DNA ...

Why do some people become addicted while others don't? Family studies that include identical twins, fraternal twins, adoptees, and siblings suggest that as much as half of a person's risk of becoming addicted to nicotine, alcohol, or other drugs depends on his or her genetic makeup. Pinning down the biological basis for this risk is an important avenue of research for scientists trying to ...

You have a lot of Neanderthal DNA. At least 99.5 percent of your DNA is identical to Neanderthal 1.. Recent DNA sequencing is revealing the truth of Neanderthal, and it is time to bury all our preconceived ideas about him and start afresh allowing DNA to be our guide.

The trouble with epigenetics is that the word means very different things in different contexts. Each of them may be quite valid, but when these meanings are conflated or when the intended meaning is not specified, the word becomes dangerously ambiguous.

Epigenetics is associated with long-term human developmental and health outcomes. It is therefore essential to better understand the biology of the epigenome, the links between epigenetic processes and gene-environment interplay, early adversity and developmental risk, and the role of developmental time.

The EMF from the sun has essentially burned a hole in the southern hemisphere's ozone layer, which in turn is allowing intense ultraviolet radiation, causing melting of part of the ice sheets in Antarctica while things have been cooling.

DNA is made of two ("duplex DNA") dextrogyre (like a screw; right-handed) helical chains or strands ("the double helix"), coiled around an axis to form a double helix of 20Å° of diameter.
